dana centre

This cutting-edge venue, complete with café bar, provides an ideal location for presentations, receptions, conferences or board meetings.

The Dana Centre is a taboo-free centre and *the* place for people to take part in exciting, informative and innovative debates about anything and everything.

So, if you have a serious presentation to make or require an inspirational and intelligent environment in which to develop ideas, make the Dana Centre your destination.

You will know just how hot the conversation is in your room via this little plastic thermometer.

It seems quite simple but it's actually quite a complex piece of equipment that only works because of substances known as liquid crystals, although they are not really liquid or solid!

The (non-toxic) crystals in this thermometer show sensitivity to temperature by changing colour; their molecules are arranged in spirals and the distance between 'spiral steps' changes with temperature. This effectively causes the crystals to reflect lights of different wavelengths, resulting in what we see... colour changes.
